

Excerpts:

Contents:

Prolog

Chapter I. The beginning of the visible universe
Formation of structure
Basic laws of nature

Chapter II. Size of visible universe
Source of organic matter
Plants, life-force
Building of life-support system

Chapter III. Animals and human species
Basic construction (genes etc.)
Soul
Social structure
Polarities
Laws of species

Chapter IV. The human mind
The soul

Chapter V. A brief history of the evolution
of human society through ages

Chapter VI. The world we live in and
the biggest challenges

Chapter VII. The way out: Change of thinking

Epilog

I. At the very point that duality manifested itself in matter, time also became one directional and by so having a reference point easy to work with.

II. In 1969 the Murchison Meteorite fell in Victoria, Australia, and it contained a lot of organic compounds including amino acids. Amino acids are asymmetrical chemical structures; they can be left or right-handed. But living organisms seem to prefer one form exclusively.

III. Nature's insurance policy for living creatures in a dynamic system is genetic diversity. By producing a great many different models so to speak, the survival of at least enough to keep the program going is guaranteed.

IV. But now lets have a look at the conscious part of the mind and the process of decision making, because apart from primeval behaviour everything anybody ever did started with a conscious thought, a however primitive that one was or still is.

Any action you take is the result of your thoughts produced by your mind. So a negative state of mind will produce destructive and negative actions. But what constitutes a negative state of mind?

Greed, envy, hatred, anger and fear are the main culprits and poisons of the mind and are learned behaviour

We have a magnificent planet with a sophisticated live support system powered by the sun, crawling with life developing along evolutionary chain reactions. And now, as the Johnny's comes lately, human beings, who have a mind and a soul and can actually choose between constructive and destructive chain reactions.

V. If the earth is twelve hours old, the dinosaurs died out 30 minutes ago, the human species has been around for less than twenty seconds and all of human history, so to speak, took place only within the last second. That fact alone explains this, but lets take one step at a time

So now let's have a look what the age of Pisces has stood for and why. It saw the final curtain fall on the ancient Egyptian Empire, the rise of Rome to superpower status and it's demise, the yellow tide of the Mongols overrunning large parts of the civilized world at that time,

VI. Genetic engineering and globalisation are two very powerful tools, which can be used for the good or bad and are already affecting the lives of millions of people.

If we don't learn from past mistakes we'll have to repeat them. When you're talking genetic engineering, this aspect is pretty horrifying

The damage to our life's support system through fossil fuel and all the other factors mentioned is the result of our ignorance of the interaction and interconnectedness of our actions with everything else on this planet.

Political correctness is a good example of making the wrong choice. We should be smarter than that. It really is part of the global problem, greed for control.

Widespread social decay and unhappiness are a result and marker beacon of the advanced stage of our alienation from nature, caused by the disregard of its laws and their relevance to our lives.

VII. So what kind of world could we expect to live in if we change our scale of values? We will not be able to get rid of residual negative factors, because they are the engines of our evolution, but the extremes of the destruction we have seen in the last few thousand years are avoidable. That alone is worth the effort.
